

# Maritime Division DSTO

A/Chief – Kevin Gaylor

# Maritime Division S&T Capability areas

Naval Architecture

Acoustic Signature Management

Non-acoustic Signature Management

Platform Survivability

Maritime Autonomy

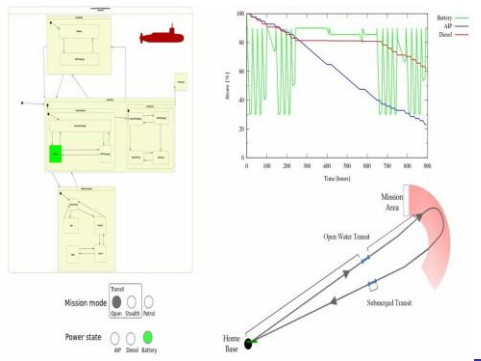

Undersea Command and Control

Sonar Technology and Systems

# Maritime Division MSTC: NAVAL ARCHITECTURE

## Platform System Analysis

## Research Leader

Dr Stuart Cannon

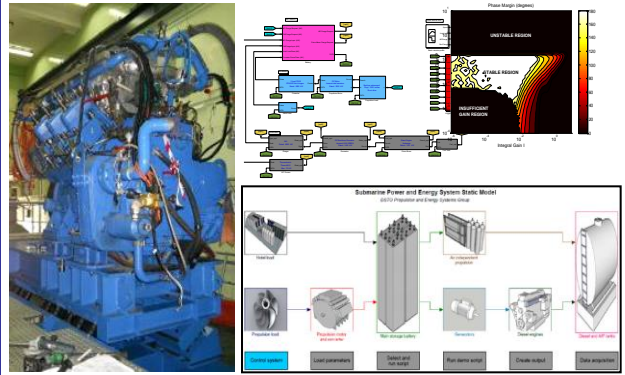

### Aims:

To ensure the RAN have platforms that are safe, efficient and sustainable for their desired operational envelope

## Seakeeping and Structural Response

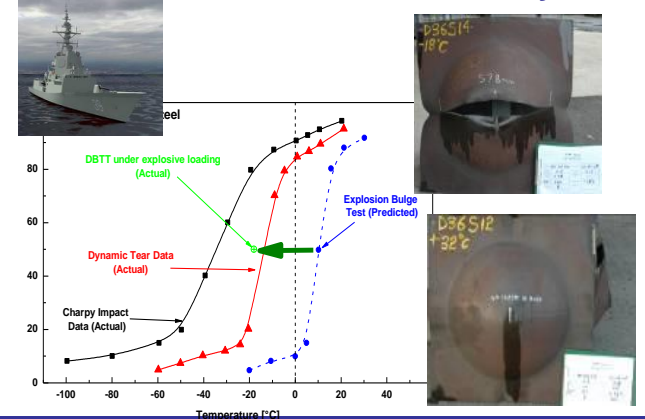

## Power and Energy Systems

### Successes

- HMAS Choules transformer investigation and analysis.
- Selection of D Grade Steel for AWD
- Improved structural reliability for the Armidale class Patrol Boats

## Structural Materials & Fabrication Systems

## Partnerships And Outreach:

### Universities

- Australian Maritime College
- University of Melbourne
- University of Wollongong
- DMTC

### Industry

- Defence Maritime Services
- Qinetiq / GRC
- Bluescope Steel
- ASC

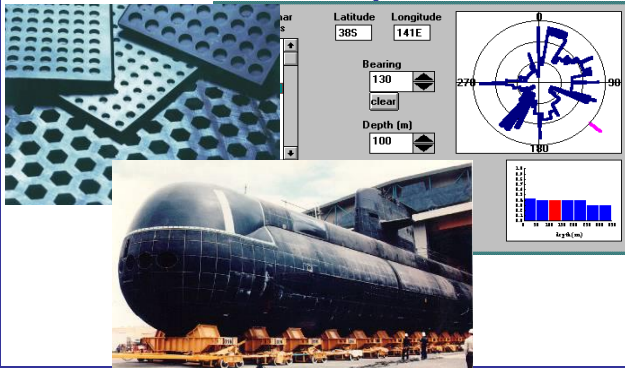

### International

- TTCP MAT & MAR
- MARIN (Holland)
- ABCANZ

# Maritime Division MSTC: ACOUSTIC SIGNATURE MANAGEMENT

## Acoustic Systems

## Research Leader

Dr Chris Norwood

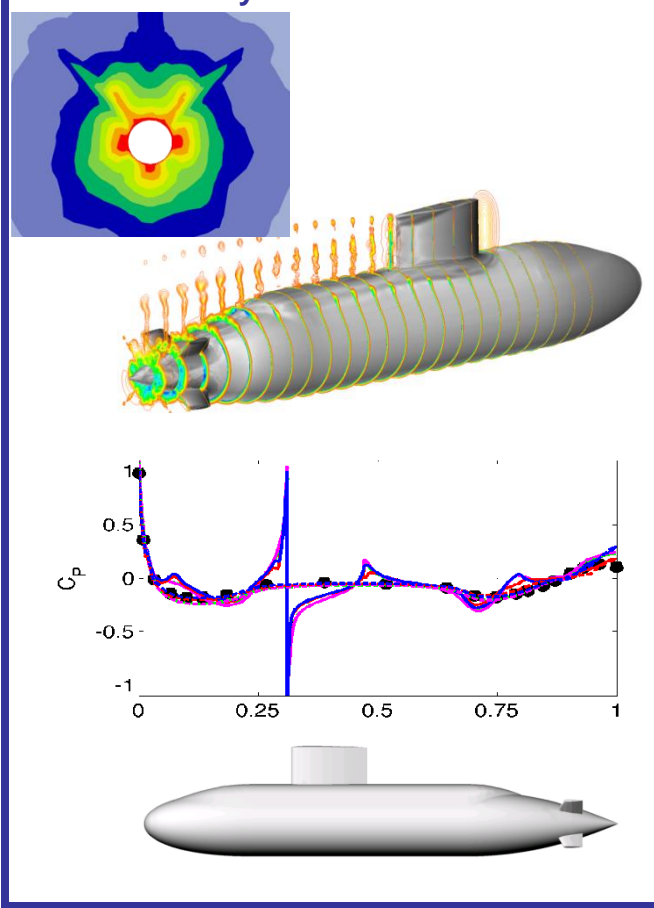

### Aims:

To control and manage the acoustic signature of RAN platforms providing increased operational effectiveness and improved survivability.

### Successes

- Anechoic tiles for Collins class submarine
- Collins class noise reduction program
- FFG 7 rudder noise treatment
- Acoustic signature monitoring system for Collins class

## Hydroacoustics

## Acoustic Signature Control

## Partnerships And Outreach:

### Universities

- University of New South Wales
- Australian Maritime College
- Adelaide University
- University of Melbourne
- UWA

### Industry

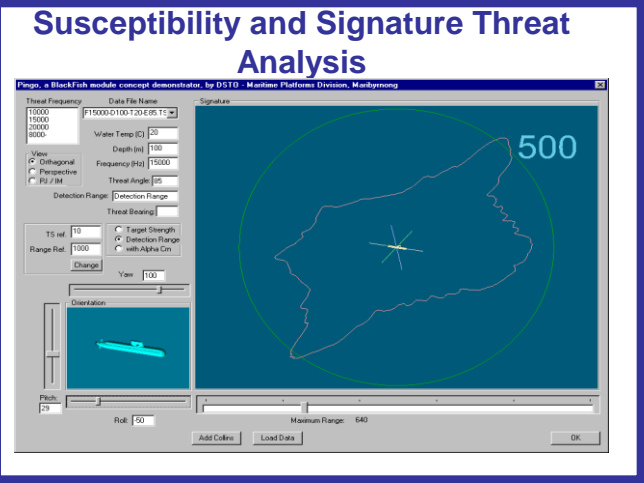

- Fraser Nash
- ASC
- McKay Rubber
- QinetiQ

### International

- TTCP MAR
- MARIN (Holland)
- NSWC (USA)
- DE&S (UK)
- FOI (Sweden)

# Maritime Division MSTC: PLATFORM SURVIVABILITY

## Research Leader Chris Gillard (Acting)

### Aims:

To ensure the operational survivability and capability of RAN platforms.

### Successes

- Collins class hull valve
- Collins class shock trial
- MHC shock testing
- Warramunga crew fatigue study
- AWD fire modelling and fire protection
- JASSM vulnerability modelling and missile damage prediction

### Vulnerability, Damage Control and Recoverability

The diagram illustrates the Integrated Survivability Assessment and Simulation Tool (ISAST) workflow. It shows a cycle between Vulnerability, Recoverability, and Evacuation. A central graph plots Capability over Time, showing the progression from a 'Damage event' through 'Detect and assess damage' to a 'Recoverability phase' where the ship can return to 'Full capability' or 'Partial capability'. Other states include 'Maximum mission capability' and 'Abort mission'. Supporting elements include Fire & Smoke, Fire Suppression, and Evacuation.

## Partnerships And Outreach:

- ### Universities
- Australian Maritime College
  - Victoria University
  - RMIT University
  - University of Greenwich

- ### Industry
- Widelinger UK
  - ASC
  - L3
  - QinetiQ

- ### International
- TTCP MAR and Weapons
  - NSWC (USA)
  - Dstl (UK)
  - ONR (USA)
  - DRDC (Canada)

# Maritime Division MSTC: NON ACOUSTIC SIGNATURE MANAGEMENT

### Electromagnetic Signature Control

### Specialised Coatings

## Research Leader

Leo De Yong

### Aims:

To ensure the RAN have platforms that have improved operational performance and increased survivability as well as reduced cost of ownership.

### Successes:

- Radar absorbing materials for Collins class submarines and surface ships
- RF interference shield for Anzac class
- New generation foul release coatings on ACPBs with quantified fuel savings
- Haze Grey colour for RAN ships

### Corrosion Science

### Environmental Signatures

## Partnerships And Outreach:

- Universities**  
 University of Adelaide  
 Swinburne University  
 University of Melbourne  
 DMTC

- Industry**  
 Mackay Consolidated  
 PPG, Akzo Nobel  
 ASC  
 BAE

- International**  
 TTCP MAT & MAR  
 NATO SET  
 ABCANZ

# Maritime Division MSTC: MARITIME AUTONOMY

## Unmanned Systems & Autonomy

## Underwater Influences, Naval Mine Sweeping & Jamming

## Research Leader Vacant

### Aims:

To advance Navy's capabilities through the use of modular portable unmanned systems with a focus on the littoral operating environment through the provision of technical advice and niche system development.

### Successes:

Autonomous operation of a REMUS 100 through on-board decision making for adaptive search, detection and classification capabilities.

Littoral environment characterization from hyperspectral data analysis.

The development of naval mine sweeping and jamming systems.

## Payload Sensors

## Partnerships And Outreach:

### Universities

Sydney University  
UNSW  
New Castle University  
CUDOS

### Industry

THALES  
Resonance Technology  
Kraken Sonar Systems

### International

TTCP MAT & MAR  
NATO MCG3  
ABCANZ

## Some sobering facts about mines

- Mine warfare began in 1776 when David Bushnell invented “Bushnell’s keg”, which was filled with black powder.
- Since World War II, more U.S. Navy ships have been damaged or lost due to mines than to all other causes combined.
- In past wars, a navy often discovered that an area was mined only after a ship entering a minefield was sunk or damaged.

- USS Tripoli –1991
- Struck a mine off the coast of Kuwait
- 5 m x 7 m hole
- Four serious injuries
- \$20M+ damage
- USS Princeton subsequently damaged by other mines while giving assistance

# Unmanned mine-countermeasures

- Mine countermeasures (MCM) remains a tedious, labor-intensive, and dangerous job that puts personnel and vessels in harm's way.
- In March 2003, during Operation Iraqi Freedom, REMUS 100 autonomous underwater vehicles (AUVs) were deployed to find mines in the port of Umm Qasr.
- It was later concluded that each vehicle could do the work of 12 to 16 human divers, and they were undeterred by cold temperatures, murky waters, sharks or hunger.
- The locations of over 100 mines were mapped.

*Underwater robots to the rescue!*

*But first, a few wrinkles...*

## Off-the-shelf autonomy...

# Advanced, customised payload autonomy

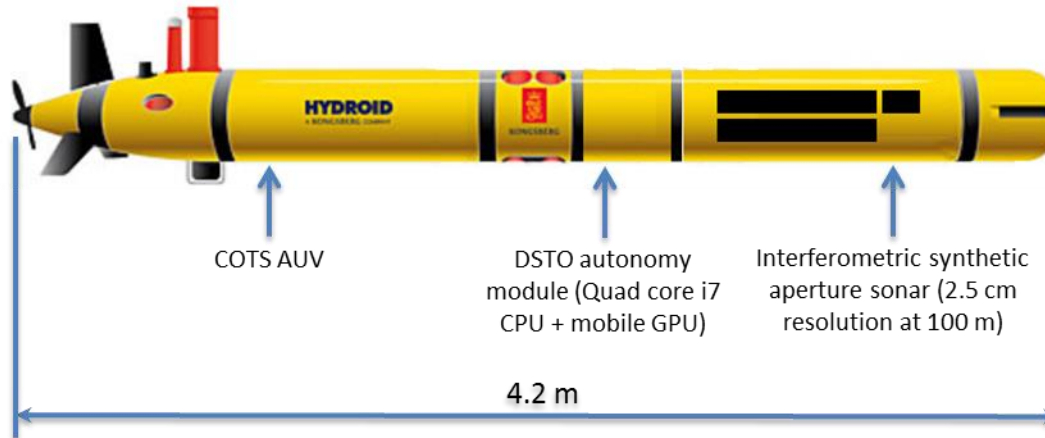

- The autonomy architecture resides onboard a customised payload computer
- The OEM vehicle computer and basic control software remains untouched
- This decouples the basic control of the vehicle (speed, heading, etc.) from the intelligent autonomy
- Changes in intelligent capabilities (behaviours) are affected through the autonomy software
- The payload computer is easily ported to different platforms
- Applications developed so far include robot navigation, path planning, vehicle/sensor simulation, automatic target recognition (ATR) and more

## DSTO MCM payloads

- Advances in embedded processing mean that sensor data can now be analysed *on-line* via automatic target recognition (ATR) algorithms which can trigger intelligent vehicle behaviours.
- At the same time, better sensors in the form of synthetic aperture sonars (SAS) have become economical, giving higher image resolutions and unprecedented detection ranges for objects of interest.

**DSTO Real-time SAS MCM Vehicle**

# Imagery from Jervis Bay 23rd – 26th April 2013

- Approximately 1.2 TB of data were acquired during the Jervis Bay sea trial.
- The effective half-swath range of the sonar at the appropriate altitude exceeded 100 m.
- The resolution achieved appeared to be better than 5 cm, roughly in-line with the specified performance.

## The DSTO ATR Challenge - International competition

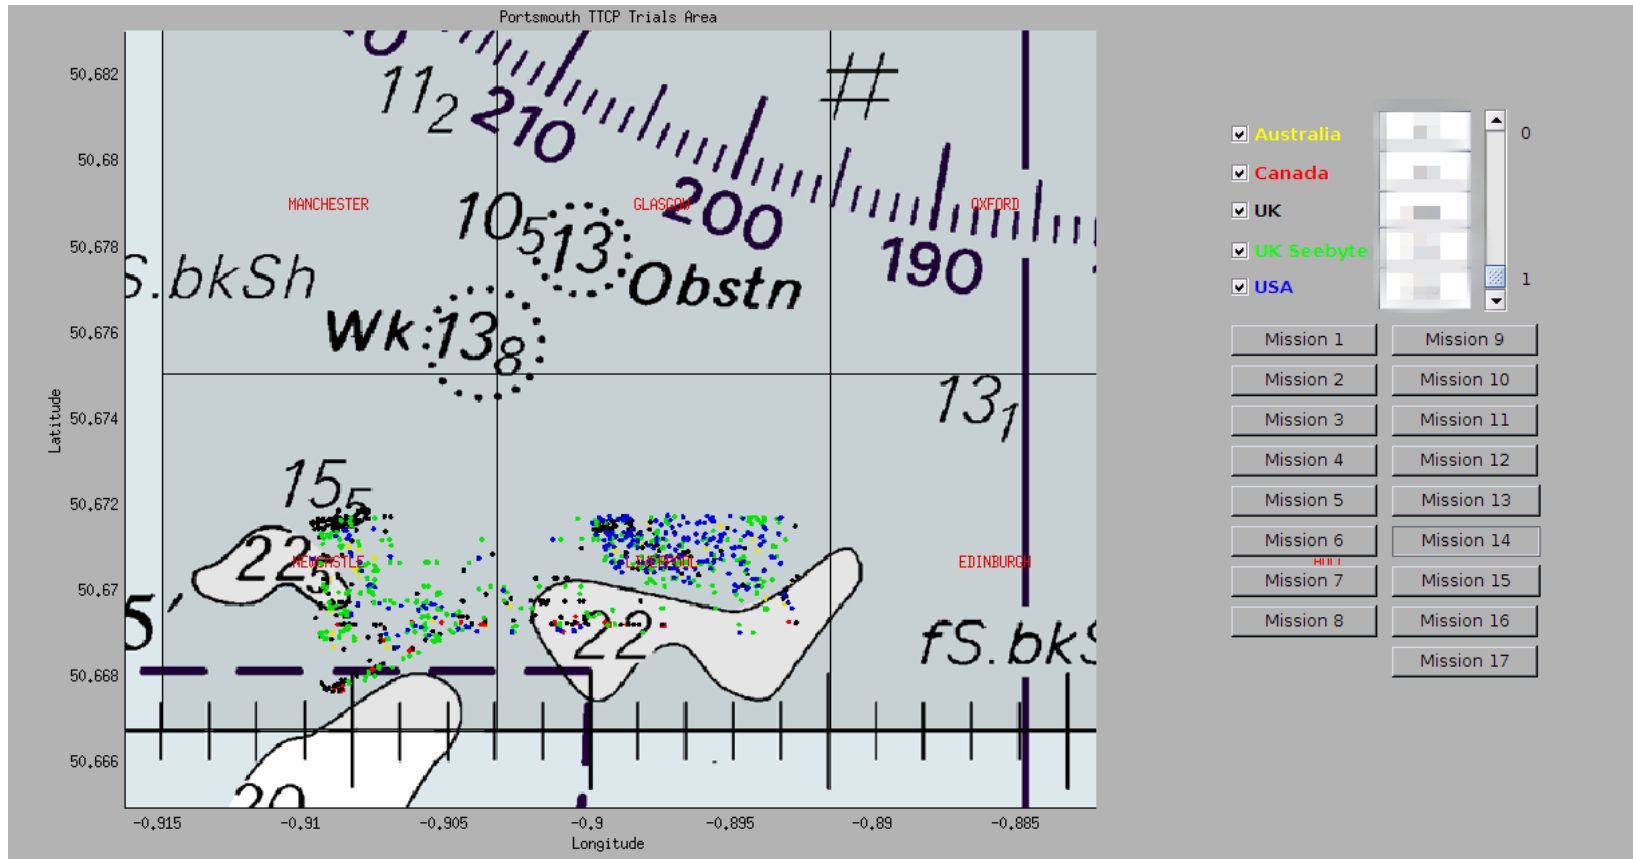

- DSTO instituted a competition for producers of ATR software
- DSTO dataset of 11,202 sidescan sonar images – REMUS 100 @ 900 kHz; range 30 to 50 m
- Training dataset and test dataset
- Participants were invited to run their ATR software through the test dataset and report their results
- DSTO analysed detection performance in comparison to human performance by RAN MW officers

[www.dsto.defence.gov.au/news/6989](http://www.dsto.defence.gov.au/news/6989)

# Results of TTCP comparative trials

- Australia performed well in relation to other TTCP nations
- In many cases, false alarm rates were significantly better
- DSTO ATR is ready for use by the RAN

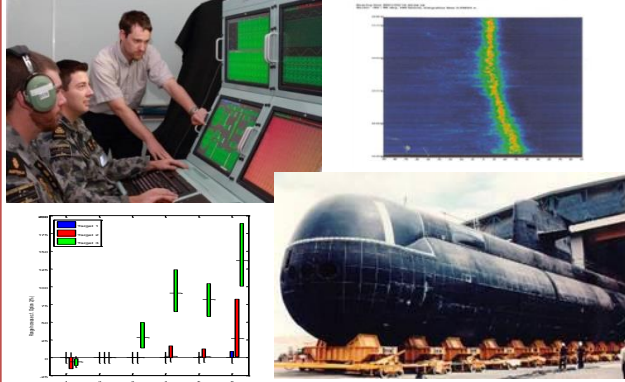

## Opportunities for industry and academia

- *Unmanned and autonomous maritime systems are emerging as crucial technologies for the future Navy.*
- *Although the ADF has adopted a predominantly COTS/MOTS approach to the acquisition of these systems, there are still significant opportunities for business and academic involvement in custom hardware, software and algorithm development.*
- *Ultimately, autonomous systems and associated robotic technologies will emerge as important sectors in the Australian economy.*

# SONAR TECHNOLOGY & SYSTEMS MSTC

## Passive Sonar (HMAS Stirling, WA)

## Active Sonar (Edinburgh, SA)

## Research Leader

Dr David Liebing

### Aim

Raise train and sustain a capability in undersea acoustic sensing and analysis that can be applied to assessing and improving current, enhanced and future ADF ASW requirements.

### Successes

**FOTA:** World-first fiber-laser hydrophone towed array demonstration (DSTO-Thales)

**BSAPS/PANORAMA** hull-mounted sonar processing system

- Licensed to Thales Australia
- RAN FFH/FFG class-wide fits
- RNZN FFH ASW Upgrade

**SENTINEL/AUSSnet** undersea sensor network (DSTO & L3-Oceania)

**GODS:** Collins Class Onboard Demonstrator

- CCSM Sonar health monitoring
- CCSM Custom sonar processing

## Sonar Processing & Performance Analysis (Edinburgh, SA)

Deployable Acoustics Replay System (DARS): Post Mission Analysis and Acoustics Training

## Partnerships and Outreach:

### Universities

- Sydney University
- University of Melbourne
- Adelaide University
- Flinders University
- University of Western Australia
- Curtin University (CMST)

### Industry & Government

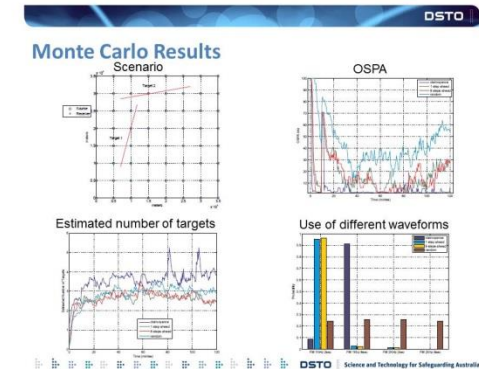

- Thales Australia
- Raytheon Australia
- Ultra (UK, CA, AS)
- STN-Atlas
- L3-Oceania
- Boeing & In-Situ Pacific
- CSIRO & Bureau Of Meteorology

### International

- TTCP MAR TP-9 (ASW Systems & Technology)
- Office of Naval Research (ONR) – HAASW PA
- NUWC/NAVSEA – IAUWS PA
- DRDC- A (Canada)
- DTA (NZ)

# General Areas of S&T Interest

- ❑ Undersea sensing technologies
- ❑ Sonar signal & information processing
  - Visualisation & display
- ❑ Sonar system simulation/stimulation
- ❑ Assess & improve sonar performance
  - Human-in-Loop (HiL)

## Example Experimental Capabilities

- ❑ Sonar Research Projector
  - At-sea measurements
  - Containerised, COOP-deployable
- ❑ Underwater Acoustic Scattering Lab
  - Precision, controlled measurements
- ❑ Acoustic Test Facility
  - General purpose underwater T&E (SA & WA)
- ❑ Deployable concept demonstrators
  - Third-party demonstration/evaluation
- ❑ Slocum undersea gliders
  - Long-endurance, unattended oceanographic measurements.

## Partnerships – One Example

### □ DSTO – Thales (Australia)

- Long duration partnership in undersea warfare
  - Mine, submarine & anti-submarine warfare
- DSTO focus: lower TRL, higher risk R&D
- Thales : industrial prototypes; end-to-end system development, test and evaluation; manufacture and customer support.
- Staff exchanges, CTD program, etc.

### □ Examples

- RAN Submarine towed acoustic array systems
  - Geophysical industry spinoff
- RAN surface combatant sonar processing system
  - Sales to RNZN

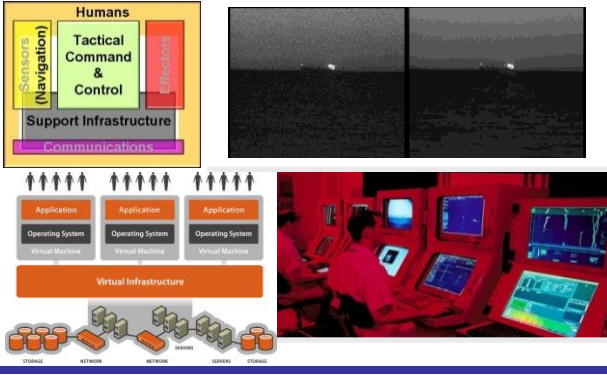

# Some Areas of Potential Partnership Interest

- Start small and grow
- Energy from the undersea/ocean environment
  - Low-power, long-endurance unattended systems
- Undersea acoustic sensing technologies
  - Acoustic and non-acoustic
    - Compact acoustic vector sensor technologies
- Sonar Signal & Information Processing
  - Target tracking, visualisation & display, sim/stim
    - Exploit COTS (e.g. GPU) computing technologies
  - Human-in-the-Loop studies

# Maritime Division MSTC: Undersea Command & Control

## Combat System Architectures

## Underwater Weapon Systems

## Research Leader

Dr David Kershaw

### Aims:

To improve the RAN undersea warfare effectiveness through improving the collection, processing and exploitation of undersea tactical information by undersea platforms and systems.

### Successes

Insertion of Australian algorithms into the MK 48 HWT and the AN/BYG Combat system

Improved weapon control displays for Collins Class submarines

Improved signal libraries for RAN torpedo countermeasures

Early Human Systems Integration advice for SEA 1000

## Human Systems & Information Integration

## Partnerships And Outreach:

### Universities

- Australian Maritime College
- RMIT
- University of Adelaide
- Curtin University
- University of Western Australia

### Industry

- BAE Systems
- Lockheed Martin
- Raytheon
- Thales
- Ultra

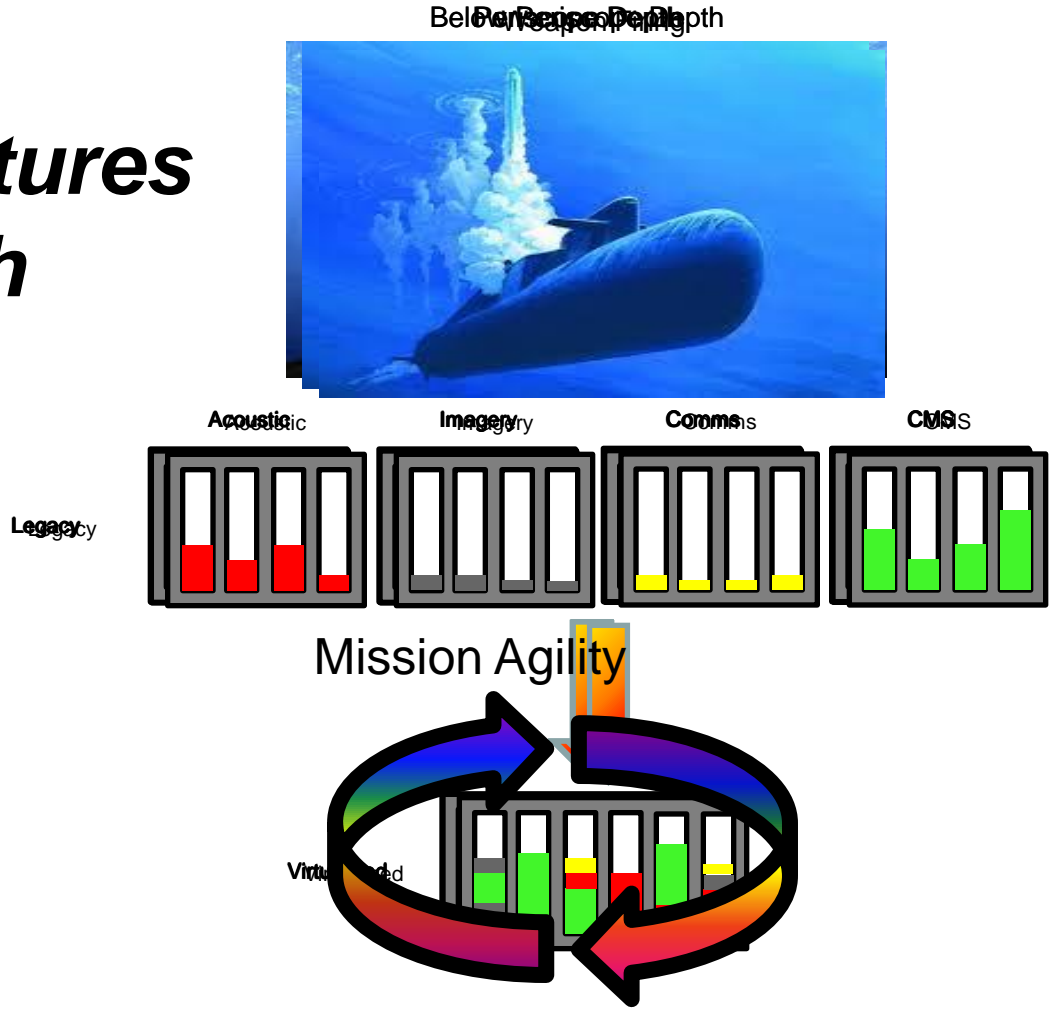

### International

- TTCP HUM & MAR Groups
- NUWC / NAVSEA (USA)
- ONR (USA)
- SPARWAR (USA)

# Combat System Architectures Research

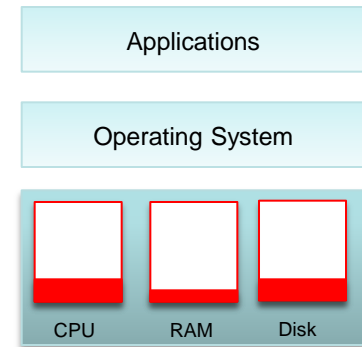

# Mission Agile Combat System

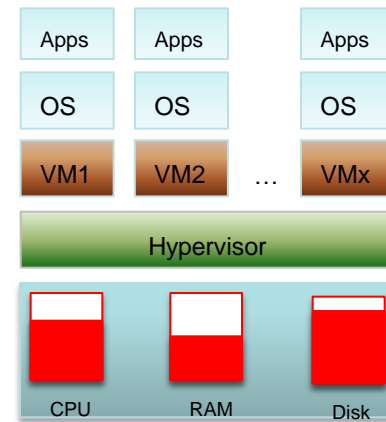

# Mission Agile Combat System

- Underlying philosophy for our Combat System Architectures program
- Model behaviour to understand operational implications, risks and issues with deployment
- Investigating technologies for:
  - Efficient implementation with a focus on Space, Weight, Power and Cooling
  - Obsolescence management
  - Enhanced distribution of processing requirements
- Designing systems while being cognisant of Cyber Security threats and implications

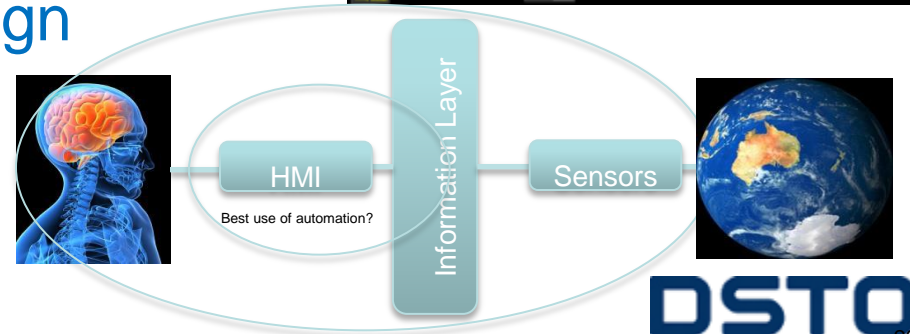

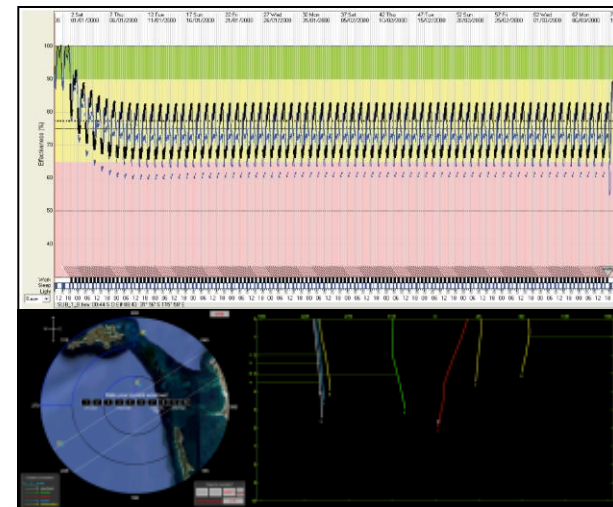

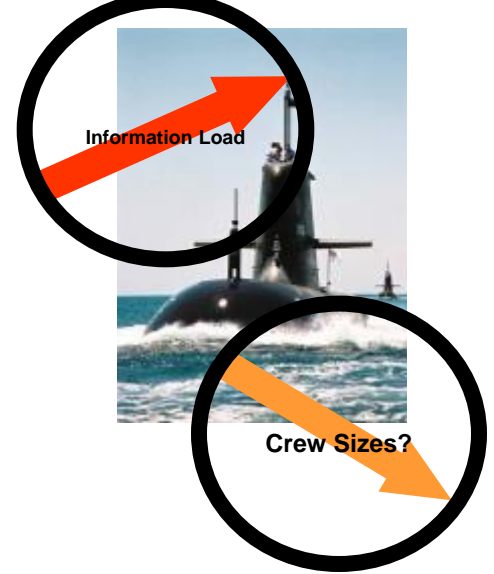

Physical

Virtual

# Human Systems & Information Integration

- Endurance R&D
  - Fatigue science to Habitation design: Maximise human performance
- Information Integration R&D
  - Situation Awareness and Automation: Knowledge in the Head (not the HMI)
  - Better harnessing automation
  - Efficient control room information flows for control room design

# Submarine Optronics

- Effects of the atmosphere
  - Measurement & Modelling
- Sensor Effects Simulation
  - Imaging sensor performance from saturation to extinction
- Image Enhancement
  - Fusion, Noise reduction

# UCC Future Directions

Submarine organic sensors and systems

*Submarine as a central node for off-board sensors and systems*
